## 3.1 Prompt

Use the technique of bounding definite integrals to find the $\Theta$ category for the function.

$$A(n) = log_2(1) + log_2(2) + log_2(3) + \ldots + log_2(n-1) + log_2(n) \tag{1}$$

Actually, you should use the integral bound technique for one equality, and use trivial analysis for the other.

## 3.2 Answer

To begin, we must draw a graph of the function and the integral:

Following from the facts that:

1. The integral is the area under the function $log_2(x)$ from 1 to $n$.

2. If we chose to view the integral as the summation of all of its length one segments from 1 to $n$ plus the integral of whatever is left over (if n is not an integer value), the resulting integral's value will be unaffected.

3. The value of each integral segment is greater than the value of its corresponding series segment because:

    (a) the value of the function and the series are equal at integer values

    (b) the value of the function increases between integers and the value of the series does not.

$\int_1^n log_2(x)$ is greater than $\sum_{i=1}^n log_2(i)$ for any $n$ greater than 1. Thus, to find the upper bound or $O$ of $\sum_{i=1}^n log_2(i)$ we merely need to find the integral of $\int_1^n log_2(x)$
So now I will calculate $\int_1^n log_2(x)$

1. Recognize that to take the integral of a logarithm, we will have to perform integration by parts. so we must chose $u$ and $dv$ values.
$$u = log_2(x) \qquad du = 1/xln(2) \qquad dv = 1 \qquad v = x \tag{2}$$

2. solve for the indefinite integral
$$\int_1^n log_2(x) = \left.\frac{ln(x)*x}{ln(2)}\right|_1^n - \int_1^n \frac{x}{xln(2)} = \left.\frac{ln(x)*x}{ln(2))}\right|_1^n - \int_1^n \frac{1}{ln(2)} = \frac{ln(x)*x}{ln(2)} - \left.\frac{x}{ln(2)}\right|_1^n =$$
$$\left.\frac{ln(x)*x - x}{ln(2)}\right|_1^n \tag{3}$$

3. solve for the definite integral
